# Agility3 - CCTV Case Study

Agility3 simulate security systems for training and recruitment

How do your CCTV operators train? Chances are they have been on a 1-week SIA approved classroom based course. They may not be familiar with the area they will be monitoring. They may not have ever seen many of the things they should be looking out for. How do you know their skills are up to scratch? Can you demonstrate that operators have undergone adequate training, are familiar with the area and know what to do when emergencies occur?

Based on commercially available simulation tools, the Agility3 CCTV simulation can replicate the environment that your CCTV operators will be working in. Scenarios can test your operators' powers of perception and CCTV system control skills, keeping them sharp and prepared for the unexpected.

A highly detailed virtual environment provides representative views through each simulated camera. Hardware controls can be integrated to provide a realistic operator interface.

A map view allows selection of cameras and provides orientation for the operator, replicating the functionality of systems in use.

Based on Presagis Vega Prime technology, the simulator provides an effective representation of the view seen through each simulated camera. Trees sway in the breeze and pedestrians go about their daily routine with the help of DI-Guy software from Boston Dynamics.

Create scenarios to simulate events that your team need to be looking out for. Help them familiarise with their patch. Test their powers of observation. Put them under pressure and see how they respond. Then do it all again until they get it right every time.

Recruiting? Put your candidates in front of the CCTV Simulator. The CCTV sim also helps ensure you recruit the best operator for the job.
